Ministry of Finance, Planning and Economic Development

ISBN 978-624-6350-55-0

Preface

The Department of Census and Statistics (DCS), in collaboration with The Ministry of Finance, Economic Stabilization and National Policies and National Planning Department, conducted the Household Survey on Impact of Economic Crisis – 2023 in Sri Lanka. This comprehensive survey, which covered the entire country aimed to provide insights into the impact of the economic crisis.

The survey involved a representative sample of 6,440 housing units from 644 census blocks across all 25 districts of Sri Lanka. It covered urban, rural, and estate sectors, as well as various types of households, including one-person households.

This survey aims to provide a detailed account of the strategies households used to navigate economic challenges. The World Food Programme (WFP) and UNDP played a crucial role in supporting the Government of Sri Lanka throughout the survey process. As the principal non-governmental agency involved, WFP provided both financial and technical assistance, including training and pretesting activities.

Fieldwork for the survey began in July 2023 and continued through September. This report is based on the findings of the Household Survey on the Impact of the Economic Crisis – 2023. The sample was sufficient to provide precise estimates at national and sector levels in Sri Lanka.

Acknowledgement

The "Household Survey on Impact of Economic Crisis - 2023" was conducted by the Department of Census and Statistics (DCS) aiming to collect data on the impact of the economic crisis. The survey specifically, focused on the impact on the education, health, employment, income, expenditure, indebtedness, social protection sectors, food insecurity and coping strategies.

The survey was coordinated by Mrs. K.M.D.S.D. Karunarathna, Additional Director General (Statistics), with planning and execution overseen by the staff of the Sample Survey Division under the guidance of Mrs. K.A.S. Kodikara, Director (Statistics), and under the direction of Deputy Directors Mr. W. Gnanathilaka, and Dr. (Mrs.) M.D.D.D Deepawansa.

The survey activities were organized and supervised by a team of statisticians including Mrs. H.M.D. Sepalika, Mr. A.K.D.C.N.S. Karunarathna, Mr. T.D.M.S.D. Perera, Mrs. U.S. Dilrukshi, Mr. L.S.N. Perera, Mrs. M.W.L.C.M. Chandraratna, Mrs. M.M.G.D. Manamperi, Ms. R.P.M. Subashini, Mr. H.M.S.C. Bandara, Ms. C.R. Liyanage and Ms. A.H.L.T. Sandaruwini from the Sample Surveys Division.

The computer data cleaning was done by the information and communication technology assistants, data entry officers/coding clerks of the Sample Survey Division and data verification was done by the statistical officers and development officers of the Sample Survey Division, under the supervision of statisticians of the sample survey division and they are acknowledged for their valuable contribution during the entire survey process.

Final tabulation and Publication preparation were carried out by Mrs. H.M.D. Sepalika, Mr. A.K.D.C.N.S. Karunarathna, Mr. T.D.M.S.D. Perera, Mrs. U.S. Dilrukshi, Mr. L.S.N. Perera, Mrs. M.W.L.C.M. Chandraratna, Mrs. M.M.G.D. Manamperi, Ms. R.P.M. Subashini, Mr. H.M.S.C. Bandara, Ms. C.R. Liyanage and Ms. A.H.L.T. Sandaruwini Statisticians under the guidance of Mr. S.H. Mansoor Director (Statistics), and the direction of Mr. W. Gnanathilaka and Dr. (Mrs) M.D.D.D. Deepawansa, Deputy Directors, Sample Surveys Division.

The Information & Communication Technology Division, under the direction of Mr. P.M.R. Fernando, Former Additional Director General (ICT), was responsible for the preparation of data entry and computer edit programs, ensuring the smooth processing of survey data.

District staff of the Department who worked on the survey deserves a special word of thanks, The Deputy Directors/ Senior Statisticians/ Statisticians supervised the survey and field Statistical Officers, worked hard at the data collection stage, to make this survey a success.

Special appreciation is rendered to the respondents of the selected households for providing accurate information for the survey.

Executive Summary

The Department of Census and statistics (DCS) conducted the Household Survey on Impact of Economic Crisis in year 2023 and covered all 25 districts in the country.

In 2023, Sri Lanka was facing one of its most challenging economic crises since gaining independence in 1948. The beginning of this can be traced back to the Easter Sunday attack in 2019, which was further exacerbated by the COVID – 19 pandemic. In the face of this economic uncertainty, Sri Lankan Government undertook a series of measures aimed at stabilizing the situation. The economic downturn trickled down to households, where the real impact of the crisis becomes most evident. Many Sri Lankan households found themselves grappling with a range of challenges in managing their daily activities. These challenges extended to income management and ensuring the well-being of family members. Recognizing the importance of understanding how households were coping with the crisis, Household Survey on Impact of Economic Crisis aims to provide a detailed account of the strategies adopted by households to face economic challenges. The key findings of the survey indicate that 60.5 percent of households have decreased their total household average monthly income and 36.6 percent no changes. Only a minor 3.4 percent of households reported increases of their income.

From the Household Survey on Impact of Economic Crisis revealed that 91.1 percent households experienced an increase in their total household average monthly expenditure. Approximately, 5.3 percent of households reported that their aggregate expenditure remained unchanged despite the impact of the economic crisis. Whereas, only 3.6 percent of households were found a decreases in their total expenditure.

Due to the economic crisis 22 percent of total households have incurred in debt. Survey findings indicated that 54.9 percent of total households are currently in debt. Highest proportion of indebtedness is due to mortgage matters (31.0 %), followed by banks (21.9%), and money lenders (9.7 %).

According to the survey result, an estimated 7.0 percent of total population changed their health treatment procedure due to the economic crisis. Among those who altered their treatment a majority reported various issues: insufficient funds (81.7 %), transport issue (33.8 %), unavailability of services or resources (23.3 %), fuel issues (19.0 %). (Note: Since respondents could select multiple options, the percentage do not sum to 100 %)

The survey revealed that 54.9 percent of individuals (aged 3 -21years) have had their schooling affected by the economic crisis at the national level. The rates for the urban, rural, and estate sectors are 54.2 percent, 55.1 percent, and 55.1 percent respectively.

Key Findings

Due to
the
economic
crisis, in
2023

54.9% of individuals (age 3 -21) schooling has been affected.

15.1% of individuals involved in economic activities have been affected by job losses (main and/or secondary).

23.1% of patients have changed their main treatment method.

22.0% of households have indebted.

51.0% of income earners who did primary jobs experienced a decrease in their income.

60.5% of households have experienced a decrease in their average monthly household income.

91.1% households experienced an increase in their average monthly household expenditure.

1. Introduction

In 2023, Sri Lanka was facing its most challenging economic crisis since gaining independence in 1948. This period of difficulty began with the Easter Sunday attacks in 2019 and was further exacerbated by the COVID-19 pandemic during 2020 - 2022 period. In response to this economic uncertainty, the government of Sri Lanka implemented a series of measures aimed at stabilizing the situation in the country. The impact of the economic downturn trickled down to households making the real effect of the crisis more apparent. Many Sri Lankan households were struggling with various challenges in managing their day-to-day activities including income and expenditure management, fulfilling commitments, and ensuring the well-being of family members. Recognizing the importance of identifying the coping strategies used by the households to overcome various difficult economic situations, the Department of Census and Statistics (DCS) initiated a comprehensive survey to assess its impact.

This survey was specifically designed to gauge how households were responding to the crisis and to provide a detailed account of the strategies they were using to navigate economic challenges. Its findings will help to evaluate these coping strategies and assess changes in access to crucial services such as healthcare, education, and

overall living standards. By illuminating the effects of the economic downturn on households, the survey provides insights into their coping mechanisms and the shifts in their access to essential services. The data collected through this survey will be invaluable in informing government policy guiding, social interventions, and shaping support mechanisms to alleviate the difficulties faced by households across the country.

This report is structured in ten chapters. Chapter two Outline the survey methodology & estimation procedure. Chapter three explores the impacts of the economic crisis on education of children aged 3 - 21 years old analysing the strategies employed to mitigate the adverse effects. Chapter four examines the crisis's effect on employment changes in people's primary and secondary jobs. Chapter five discusses the direct impact of the economic crisis on people's health including access to treatment, and treatment patterns. Chapter six addresses income-related information, distinguishing between monetary and non-monetary income, and discusses changes in agricultural and non-agricultural income. Chapter seven describes how household expenditure, including food and non-food expenses, has been affected during the economic crisis. The economic crisis directly affected on household income & expenditure patterns. Therefore, many households used various coping strategies

to mitigate its impact and that is discussed in Chapter eight. Chapter nine observed the indebtedness of the households by identifying the reasons for Indebtedness, and lending sources. Recovering from the crisis of economically and socially disadvantaged groups need more time to recover the income and livelihood losses caused by the economic crisis. Government agencies and non-governmental organizations (NGOs) provide assistance to vulnerable people through variety of social protection programs to alleviate the vulnerabilities in different social groups.

Chapter nine includes detailed information of households benefited from social security schemes in Sri Lanka. The establishment of food security in the country is essential to build a healthy nation, therefore it is essential to find whether all people, at all times, have physical and economic access to sufficient safe and nutritious food, that meets their dietary needs and food preferences for an active and healthy life in this critical situation. Therefore, the exiting situation in the country is discussed in chapter ten.

2. Survey Methodology & Estimation Procedure

Sampling plan and the sampling frame

For the Households Survey of Economic Crisis, two-stage stratified sampling procedure was used to select a sample of 6440 housing units. The sampling frame for this survey was based on the 2012 Census of Population and Housing.

Sample Design and Allocation

A total of 644 Primary Sampling Units (PSU's) were allocated to each district and sector (urban, rural and estate) using the Neymann allocation method, which take into account the variance of the unemployment rate. Table 2.1 details the sample distributions by district. The survey was conducted from July to September 2023.

Primary Sampling Units (PSUs) used in the survey are the census blocks prepared for the Census of Population and Housing - 2012.

Secondary Sampling Units (SSUs) are the housing units within the selected 644 Primary Sampling Units (PSUs). From each selected PSU, 10 housing units (SSUs) were selected for the survey using a systematic random sampling method.

Table 2.1: Sample Allocation by District - 2023

District	No. of Housing Units	District	No. of Housing Units
Total	6440	Mullaitivu	100
Colombo	610	Kilinochchi	100
Gampaha	650	Batticaloa	190
Kalutara	300	Ampara	230
Kandy	440	Trincomalee	130
Matale	180	Kurunegala	480
Nuwara Eliya	200	Puttalam	210
Galle	340	Anuradhapura	230
Matara	290	Polonnaruwa	160
Hambantota	230	Badulla	230
Jaffna	180	Monaragala	150
Mannar	110	Rathnapura	320
Vavuniya	120	Kegalle	260

Estimation procedure

Let $\hat{X}_{jk}$ be the estimate of any given characteristic for jth district for the kth month.

This could be given by,

$$\begin{aligned} \hat{X}_{jk} = & \frac{1}{m_{jk(u)}} \sum_{h(u)=1}^{m_{jk(u)}} \frac{1}{P_{h(u)}} \frac{N_{h(u)}}{n_{h(u)}} \sum_{i(u)=1}^{n_{h(u)}} X_{hi(u)} \\ & + \frac{1}{m_{jk(r)}} \sum_{h(r)=1}^{m_{jk(r)}} \frac{1}{P_{h(r)}} \frac{N_{h(r)}}{n_{h(r)}} \sum_{i(r)=1}^{n_{h(r)}} X_{hi(r)} \\ & + \frac{1}{m_{jk(e)}} \sum_{h(e)=1}^{m_{jk(e)}} \frac{1}{P_{h(e)}} \frac{N_{h(e)}}{n_{h(e)}} \sum_{i(e)=1}^{n_{h(e)}} X_{hi(e)} \end{aligned}$$

Where,

$m_{jk(u)}$ = Number of census blocks selected from the urban sector of the jth district for the kth survey month.

$P_{h(u)}$ = Selection probability of the hth census block in the urban sector.

$$P_{h(u)} = \frac{S_{jh(u)}}{\sum_{h=1}^{m_{jk(u)}} S_{jh(u)}}$$

Figure1.1: Sample allocation by district - 2023

$S_{jh(u)}$ = Measure of size (number of housing units) of the h^{th} census block in the urban sector of the j^{th} district.

$M_{jh(u)}$ = Total number of census blocks in the urban sector of the j^{th} district.

$N_{h(u)}$ = Total number of housing units listed in the h^{th} census block in the urban sector.

$n_{h(u)}$ = Number of housing units selected from the h^{th} census block in the urban sector.

$X_{hi(u)}$ = The observed value for the i^{th} sample household in the h^{th} census block in the urban sector.

$m_{jk(r)}$, $P_{h(r)}$, $S_{jh(r)}$, $M_{jh(r)}$, $N_{h(r)}$, $n_{h(r)}$, and $X_{hi(r)}$ are corresponding terms for the rural sector and

$m_{jk(e)}$, $P_{h(e)}$, $S_{jh(e)}$, $M_{jh(e)}$, $N_{h(e)}$, $n_{h(e)}$, and $X_{hi(e)}$ are corresponding terms for the estate sector.

The estimate for the total value of a characteristic for the country for month k ,

$$\hat{X}_k = \sum_{j=1}^{25} \hat{X}_{jk} \quad \text{--- (1)}$$

The estimate for the total value of a characteristic for the j^{th} district, is based on all 12 rounds.

$$\hat{X}_j = \frac{1}{12} \sum_{k=1}^{12} \hat{X}_{jk} \quad \text{--- (2)}$$

The total estimate for the total value of a characteristic for the urban sector of the country, based on all 12 rounds.

$$\hat{X}_u = \frac{1}{12} \sum_{k=1}^{12} \sum_{j=1}^{25} \hat{X}_{jk(u)} \quad \text{--- (3)}$$

Where,

$$\hat{X}_{jk(u)} = \frac{1}{m_{jk(u)}} \sum_{h(u)=1}^{m_{jk(u)}} \frac{1}{P_{h(u)}} \frac{N_{h(u)}}{n_{h(u)}} \sum_{i(u)=1}^{n_{h(u)}} X_{hi(u)}$$

Similarly $\hat{X}_e$ and $\hat{X}_r$, rural and estate sector estimates for the country can be obtained.

Adjustment for unit non-response

The occurrence of unit non-response was determined by examining the final result code recorded in the control data section of the schedule. Based on these final result codes, households were categorized into the following groups, which were used as the basis for adjusting for the unit non-response.

Category and description

1. Schedule completed	1
2. Housing unit demolished or vacant	3
3. Unable to complete schedule, Refusal, Temporarily away etc.	2,4,5,6,7

Category 1 and 2

These cases were considered as fully accounted for, as a schedule was completed to the extent required at the time of the interview. Therefore, no adjustment was necessary.

Category 3

This is incomplete, therefore; a non-response adjustment was made for this category. The adjustment was based on the assumption that the proportion of households in Category 3 is the same as the corresponding proportion in Category 1 for the sample households.

This assumption was applied on a block-by-block basis separately for urban, rural and estate sectors. The block weight before adjusting for unit non-response was

$$W'_h = \frac{1}{m_{jk}} \sum_{h=1}^{m_{jk}} \frac{1}{P_h} \frac{N_h}{n_h}$$

Where,

N_h = Total number of housing units listed in block h.

n_h = Number of housing units selected in block h.

The revised weight should take the form

$$W_h = W'_h \left(\frac{n^1_h - n_{h2}}{n_{h1}} \right)$$

Where,

n_{h1} = Number of sample households in category 1.

n_{h2} = Number of sample households in category 2.

n^1_h = Total number of households in all categories (category 1, 2 and 3) = (n_h)

3. Education

Human capital is one of the critical factors in the economic development of a country. It is important to confirm the quality of human capital or the workforce in accelerating economic growth. Since education is profitable investment for economic and social well-being, the accumulation of human capital through education has been given priority in Sri Lanka's national policies. Since Sri Lanka is a country that provides free education from kindergarten to university, Sri Lanka has a leading position in terms of literacy in South Asia.

The recent economic crisis has directly and indirectly impacted the country's economy, daily life and the education sector. This survey examines how individuals aged 3 to 21 years have been affected by the economic crisis. It aims to understand the effects on their education and to identify strategies they have adopted to mitigate the negative impact of the economic downturn.

Figure 3.1
Percentage of persons aged 3-21 with school education

Source:
Department of Census and Statistics, Sri Lanka

According to Figure 3.1, the majority of the individuals, 74.6 percent had been reported that they are currently attending to the school. Additionally 14.4 percent individuals reported that they have attended to the preschool or school in the past.

Figure 3.2
Percentage of main mode of travel to school of currently school attenders

Source:
Department of Census and Statistics, Sri Lanka

According to Figure 3.2, the most common mode of travel to school among students was walking (28.7%). The second most common mode of travel was travel by bus, used by 25.6 percent of students. Additionally, 21.2 percent use motorbikes or three-wheelers as their main mode of travelling while 12.3 percent used school van or bus.

Table 3.1: Percentage of persons (aged 3 -21 years) whose schooling has been affected by the economic crisis

Effect	National (%)	Sector (%)		
		Urban	Rural	Estate
Affected	54.9	54.2	55.1	55.1
Not Affected	45.0	45.8	44.9	44.9
Total	100	16.4	78.7	4.9

According to table 3.1, 54.9 percent of individuals aged 3 to 21 years had their schooling affected by the economic crisis. The proportion in urban, rural and estate sectors are 54.2 percent, 55.1 Percent and 55.1 percent respectively.

Figure 3.3
Percentage of persons (aged 3-21) that have adopted at least one strategy for the impact of the economic crisis on schooling

Figure 3.3 illustrates that 93.5 percent of individuals aged 3 to 21 years, whose schooling was affected by the economic crisis, employed at least one strategy to mitigate the impact at the national level.

According to the data presented in Figure 3.4, the primary strategy adopted by the majority of individuals affected by the economic crisis was to either reduce their

expenditure on new stationery or stop purchasing it altogether, with 53.2 percent of respondents choosing this approach.

The second most common strategy used, 44.0 percent of individuals was cut down on buying new uniforms or stopped purchasing them altogether. Additionally, reducing the frequency of attending tuition classes or shifting to online classes were the third and fourth most commonly adopted strategies, with 40.6 percent and 28.1 percent of respondents opting for these measures, respectively.

Figure 3.4
Percentage of most used strategies to mitigate the impact of the crisis on schooling

4. Employment

Employment is a key component of economic growth. To capture the impact of the economic crisis on employment, data was collected from individuals aged 15 years and older. Those who engaged in economic activities for at least one hour in the week before the survey were classified as economically active. Consequently, all the individuals in the sample who engaged in economic activities were identified and information was collected on their employment and any changes in their work since March 2022.

This survey aimed to capture two primary impacts of the economic crisis on the employment of working-age individuals since March 2022.

- Job loss: Information on individuals who have lost their jobs as a result of the economic crisis.
- Changes in current jobs: Information on any alterations or changes individuals have experienced in their current jobs that are directly linked to the ongoing economic crisis.

Job loss

Some people were at risk of losing their jobs, and information was collected on individuals' main and secondary job losses due to the economic crisis. The reference period for job losses was taken from March 2022 until the time the survey was conducted.

Figure 4.1 illustrates the job loss status by gender of individuals aged 15 years and older who were involved in economic activities during the economic crisis. The figure highlights that 15.1 percent of individuals lost their jobs (main and/or secondary) due to the impact of the economic crisis.

Moreover, the data indicates a higher percentage of males lost either their main and/or secondary jobs due to the economic crisis compared to females.

Additionally, the results demonstrate that 84.8 percent of individuals did not experience any job loss during the crisis period and continued in the same jobs they already held.

Changes in current jobs

This survey captured the changes that employed individuals experienced in their current jobs due to the economic crisis. These changes included work breaks or

temporary absences, reductions in working hours, cuts in pay or allowances, and income loss.

Figure 4.2 shows the percentage of employed individuals who experienced any change mentioned above in their main and/or secondary due to the economic crisis. As depicted in Figure 4.2, 69.3 percent of the employed population experienced any change in their current job. Additionally, a higher percentage of male employed persons experienced any change in their current job compared to the females.

When considering only the main job, Table 4.1 shows the percentage of employed persons based on the changes they experienced due to the economic crisis.

According to Table 4.1, nearly half of the employed individuals experienced one or more following changes in their main occupation due to the economic crisis (work breaks or temporary absences, reductions

in working hours, cuts in wages or allowances, and loss of income).

Table 4.1: Percentage of employed persons who experienced a change in their main job due to the economic crisis by the type of change

Type of change	% of persons experienced a change in main job
Work breaks or temporary absence	47.3
Reduction in working hours	48.0
Pay/allowance cut or income loss	45.8

Employed persons can be classified based on their employment status as either an employee or trainee, employer, own account worker or contributing family worker. As depicted in Figure 4.3, more than half of the employed individuals in each employment status experienced some form of change in their current job. Among these changes, the highest percentage was reported from employers and the lowest percentage was reported from government/semi-government or private employees.

5. Health

The economic crisis in the country has impacted on the treatments that patients received for their diseases. It is estimated that around 29.1% of the population has experienced some form of illness during this period. Fuel and transport issues, along with a shortage of drugs and treatment materials, have emerged as significant problems due to this challenging environment.

Table 5.1: Percentage of patients forced to change their main treatment by the type of challengers by sector

Sector	Lack of funds	Unavailability of services or resources	Fuel problem	Transport issues
Urban	17.4	3.6	4.3	9.1
Rural	19.0	4.9	3.8	10.2
Estate	19.9	6.9	6.9	19.9
Total	18.8	4.8	4.0	10.5

Note :The Sum of percentages is not 100% due to multiple responses

Table 5.1 presents the percentage of patients who were forced to change their main treatment due to various challenges by urban, rural and estate sectors. The most commonly reported challenge across all sectors was a lack of funds, affecting 18.8 percent overall. This issue was slightly more prominent in the estate sector (19.9 %), followed by the rural (19.0 percent) and urban sector (17.4 percent).

The Estate sector reported the highest impact from all other challenges as well, including unavailability of services or resources (6.9 %), and transport issues (19.9 %). Transport issue in estate sector was nearly double the national average of 10.5 percent.

The urban sector consistently reported the lowest impact from these challenges except fuel problem, while the rural sector showed moderate levels. The data also notes that the percentages do not total 100 percent due to respondents could select multiple challenges.

Table 5.2 presents the distribution of patients by the type of main treatment received across urban, rural and estate sectors in Sri Lanka.

Across all sectors, the most common form of treatment was drug use, with approximately 70.6 percent of patients in both urban and rural sectors on medication. In contrast, only 50.8 percent of patients in estate sector reported drug use, indicating a significant deviation from the national value of 69.8 percent.

The estate sector showed a much higher dependence on clinics (32.7 %), more than double the urban (14.5%) and rural (16.6%) figures, suggesting limited access to other forms of care or a stronger dependency on basic clinic services. Estate areas also had slightly higher percentages for surgery (7.4%), therapy (2.1%), and 'Other'

treatments (6.7%), compared to national averages.

Self-treatment was the least common across all sectors, especially in the estate sector (0.3 percent), while still remaining low in urban (1.9%) and rural (1.2 %) areas.

Overall, the data highlights disparities in treatment patterns between sectors, particularly the heavy dependence on clinics and lower drug use in the estate sector, which may reflect differences in access, affordability, or healthcare infrastructure.

Table 5.2: Percentage of the patients by the type of main treatment

Sector	Surgery	Therapy	Clinics	Drug use	Self-treated	Other	Total
Urban	7.0	1.4	14.5	70.6	1.9	4.7	100.0
Rural	6.0	1.3	16.6	70.6	1.2	4.4	100.0
Estate	7.4	2.1	32.7	50.8	0.3	6.7	100.0
Sri Lanka	6.2	1.3	16.8	69.8	1.3	4.5	100.0

Table 5.3: Percentage distribution of the patients by the type of place they attend for their main treatment

Sector	Hospitalized				Outpatients Treatments / Clinics				Other
	Western Medicine		Indigenous Medicine		Western Medicine		Indigenous Medicine		
	Govt	Pvt	Govt	Pvt	Govt	Pvt	Govt	Pvt	
Urban	21.8	3.9	0.3	0.1	34.2	31.0	1.3	2.9	4.6
Rural	18.6	1.8	0.5	0.3	48.2	22.2	2.0	1.9	4.5
Estate	21.4	3.4	0.7	1.0	58.0	10.7	0.8	0.2	3.7
Sri Lanka	19.3	2.2	0.4	0.3	46.2	23.3	1.9	2.0	4.5

Table 5.3 presents the percentage distribution of patients by the type of place they attended for their main treatment, categorized by urban, rural, estate sectors and by type of provider, Government or Private and type of medicine, Western or Indigenous.

In terms of hospitalization, government hospitals offering Western medicine were

the most utilized across all sectors. The highest usage was observed in the urban sector (21.8 %) and estate sector (21.4 %), with a national average of 19.3 percent. private hospitals played a relatively minor role in inpatient care, especially in the rural sector with 1.8 percent and estate sector with 3.4 percent, though slightly more common in urban sector with 3.9 percent.

Hospitalization through Indigenous medicine, whether government or private, remained very low across all sectors, with percentages below 1 percent.

For outpatient care or clinic visits, government facilities offering Western medicine were the most frequently used, particularly in the estate sector (58.0%), followed by the rural sector (48.2%) and urban sector (34.2%). This indicates a strong reliance on government outpatient services in less urbanized areas. Conversely, private outpatient clinics offering Western medicine were more popular in urban sector (31.0%), and in rural sector (22.2%) and estate sector (10.7%). This variation may reflect differences in both accessibility and affordability of private healthcare.

The use of Indigenous outpatient services, both government and private were minimal across all sectors, with each category typically accounting for less than 3% of responses. Finally, a small proportion of patients reported receiving their main treatment in other types of settings not specified in the main categories, ranging from 3.7 percent in the estate sector to 4.6 percent in urban sector.

Overall, Table 5.3 highlights significant sectoral differences in healthcare access and preferences. Government healthcare services, particularly those offering Western medicine, dominate across all sectors, especially in rural and estate sectors.

Meanwhile, private healthcare, especially outpatient treatment is more prominent in urban regions, suggesting socioeconomic and geographic disparities in healthcare utilization.

Figure 5.1

Percentage distribution of patients by the type of change taking place in their main treatment

Source:

Department of Census and Statistics, Sri Lanka

DCS

Note: Sum of percentages is not 100% due to multiple responses

Figure 5.1 presents the percentage distribution of patients based on the type of changes that occurred in their main treatment during the crisis period.

According to the responses, among those who changed their treatments, 35.1 percent of patients reported changing their place of treatment. 31.1 percent of patients reported using different drugs than they typically use while 32.1 percent have taken a lower dose than prescribed. Further 33.9 percent have stated that they use medications when they feel their condition is becoming critical.

It is noted that among the total patients, around 1.3 percent are self-treated and 4.5% indicated that they have not taken any treatment.

The self-treated patients have faced the following issues in their treatments.

Figure 5.2
Issues faced by the self-treated patients for their illness, during the period of economic crisis

Source: Department of Census and Statistics, Sri Lanka

Note: The sum of percentages does not equal to 100 % since the multiple conditions are included in responses.

The issues faced by the patients who did not get any treatment for their illness are as follows.

Figure 5.3
Issues faced by the patients who did not get any treatment for their illness during the period of economic crisis

6. Household Income

Gathering information on household level income is important as it is an essential indicator of to measure the country's economic situation. Understanding the impact of the economic crisis on households' income is particularly important for making evidence-based policy decisions regarding the stabilization of the country's economy. Therefore, this survey collected data on non-monetary income and monetary income.

Collecting accurate income data from individuals is a challenging task, as many people are reluctant to disclose their actual income. To address this, income data was collected under various components, including wages and salaries, seasonal and non-seasonal crops, agricultural activities and other cash receipts such as pensions, dividends, rents, interest from savings, remittances, and local and foreign transfers. Additionally, income by chance or ad-hoc gains such as compensation, lottery winnings as well as sales of goods and savings was included. In addition to the value of freely received household food, non-food items were also collected as non-monetary income. Total monthly household income was calculated by summing both monetary and non-monetary income.

Table 6.1 Income ranges for each household income quintile

HH income quintile	Income range (Rs.)
1	Below 27,444
2	27,444 - 49,607
3	49,608 - 73,489
4	73,490 - 1,17,903
5	Above 1,17,903

Figure 6.1

Income ranges for each household income quintile

Source:

Department of Census and Statistics, Sri Lanka

DCS

Total monthly household income is categorized into five income quintiles, and the percentage of households in each quintile is given in Figure 6.1 and Table 6.1. Nearly one-third of total households in the urban sector have an average monthly income exceeding Rs. 117,903.00, placing them in the 5th quintile. In contrast, 27 percent of the households in the estate sector belong to the 1st quintile with their monthly income below Rs. 27,443.00.

Figure 6.2 shows the contribution from each source of income to the monthly household income. Results reveal that the highest percentage share of total monthly

household income is covered by wages and salaries, representing 43.5 percent for the country. Additionally, 15.4 percent of total income is covered by non-agricultural activities, while 7.4 percent by agricultural activities in Sri Lanka. In the estate sector, salaries and wages make the largest contribution to the total income. In, the rural sector derives a higher income share from agricultural activities compared to other sectors.

Figure 6.2
Percentage share of household income by main source of income in urban, rural, estate and Sri Lanka

Source: Department of Census and Statistics, Sri Lanka DCS

The impact of economic crisis on individuals' salaries or wages

The analysis involved a comprehensive examination of the impacts of the recent economic crisis on various sources of income. To measure the effects of the economic crisis on income, the survey asked each household member about changes in their income related to

employment, agricultural activities, or non-agricultural activities. Participants were specifically asked to indicate whether their income had changed since March 2022. The Figure 6.3 presents the percentage of income earners whose primary job income has decreased, changed, or increased by sector due to the economic crisis.

Figure 6.3
Percentage of income earners whose primary jobs' income decrease change or increase by sector

Source: Department of Census and Statistics, Sri Lanka DCS

Fifty-one percent of income earners experienced a decrease in their income from primary jobs due to the economic crisis, while 46.6 percent reported no changes. Only 2.3 percent of income earners experienced an increase in their income from primary jobs in Sri Lanka.

However, 52.2 percent of income earners in primary jobs within the urban sector did not experience any changes in their wages and salaries due to the economic crisis, compared to 45.4 percent in the rural sector and 43.3 percent in the estate sectors.

Reasons for decreasing income of primary jobs

The main reasons for the decrease income from primary jobs were identified in the survey, and the results are shown in Figure 6.4.

Figure 6.4
Reasons behind the decreasing income of primary job

Source: Department of Census and Statistics, Sri Lanka DCS

Sixty-two percent of income earners experienced a decrease in their earning from primary jobs due to reduced working hours during the period of the economic crisis. Additionally, 17 percent of income earners who reported a decline in income either lost their jobs or changed their jobs.

Reasons for the increase in income from primary jobs

Fifty-nine percent of income earners who experienced an increase in their primary income reported that salary increments were the main reason for this income increment during the economic crisis. Additionally, 22 percent attributed their income growth to high exchange rates during that period. Although, we gathered

information on various reasons for the increase in primary job income, the small percentage (2.3%) of income earners experiencing an increasing is insufficient for a comprehensive analysis due to small sample counts about all the reasons behind the increasing income during the economic crisis. Further, the survey revealed that 5 percent of income earners experience changes in the frequency of their salary payments due to the economic crisis.

The impact of the economic crisis on individuals' agricultural income

Section 6.2 of the schedule contains information on the fluctuation of agricultural income due to the economic crisis, with changes in the income of selected major crops shown in Figure 6.5.

Figure 6.5
Percentage of agricultural income earners experiencing decreases, changes or increases in income from paddy, tea, rubber and coconut

Source: Department of Census and Statistics, Sri Lanka DCS

Figure 6.5 illustrates that 83 percent of paddy cultivators experienced a decrease in their income due to the economic crisis, while 52.7 percent of tea cultivators

reported the similar decline. However, nearly one-fifth of tea cultivators' income has increased during the economic crisis. In contrast, 82.7 percent of coconut cultivators stated that their income had not changed during the economic crisis.

The impact of the economic crisis on persons' non-agricultural income

Figure 6.6 presents the percentage distribution of non-agricultural income earners experiencing decreases, no changes, or increases in income from production, trade, and transportation. Non-agricultural income earners were challenged with a lot of difficulties during the economic crisis.

Therefore, understanding their income fluctuations due to the economic crisis is very important for decision-making. To assess the situation, several questions about income changes were included in the survey.

The Figure 6.6 presents the impact of the economic crisis on the income of non - agricultural income earners in the production, trade, and transportation sectors. Most non-agricultural income earners experienced a reduction in their income due to the economic crisis with the transport sector being the most affected.

DCS

7. Household Expenditure

Household expenditure refers to the total amount of money that a household spends on goods and services over a specific period. This includes essential expenses such as food, housing, utilities, transportation, healthcare, and education, as well as discretionary spending on entertainment and leisure activities. Analysing household expenditure patterns provides valuable insights into consumer behaviour, economics, health, and the standard of living within the country. Understanding these patterns can help policymakers in making informed decisions to support families and stimulate economic growth. In section 4 of the survey schedule, data related to household food and non-food expenditures were collected. Figure 7.1 shows the percentage of households by monthly household expenditure categories.

Figure 7.1
Percentage of households by monthly household expenditure categories

Source:
Department of Census and Statistics, Sri Lanka

The percentages distribution of monthly households' expenditure in each sector by expenditure categories are shown in Figure 7.2. In the estate sector 22 percent of households spend less than Rs. 40,000 while most of the households in the estate sector (35%) spend between Rs.40,000-Rs.60,000. In the rural sector, nearly 60 percent of households' monthly household expenditure is less than Rs 80,000 and only 6 percent spend more than Rs.150,000 per month.

Figure 7.2
Percentage of households by monthly household expenditure categories in each sector

Source:
Department of Census and Statistics, Sri Lanka

Monthly household expenditure in the urban sector is considerably higher with respect to the both rural and estate sectors. In the urban sector, 27 percent of households spend between Rs 100,000 and Rs.150,000 while 23 percent of households' monthly expenditures exceed Rs.150,000. Only 4 percent of households in the urban

sector spend less than Rs.40,000 per month.

Figure 7.3 illustrates the average percentage share of monthly household expenditure on food and non-food items. Households spend 56 percent of their total monthly expenditure for food items and 44 percent for non-food items monthly.

Figure 7.3:
Average percentage share of monthly household expenditure on food and non food items

Source:
Department of Census and Statistics, Sri Lanka

In section 4.2 of the survey schedule, information on non-food expenditures were collected under eighteen categories. Additionally, expenses related to alcohol and drugs are considered as non-food items for analysis. The average percentage share of expenditure related to each category is shown in the Figure 7.4.

Households have spent more on housing rent (including imputed rent), taxes and water bills. They spent 5.2 percent of their monthly household expenditure for fuel & lights, 4.2 percent for education and 3.6 percent for health expenses respectively.

Figure 7.4:
Average percentage share of monthly household non - food expenditure categories

Department of Census and Statistics, Sri Lanka

8. Impact of Economic crisis on Household income, Expenditure, and Coping strategies

The impact of the economic crisis on household income and expenditure is significant. This crisis has led to significant changes in how households manage their finances. Many households have experienced a decrease in their income due to various economic factors, which have subsequently affected their spending pattern. Various coping strategies and responses have been adopted to overcome or minimize the impact in these challenging times. Many households have used multiple coping strategies to overcome this impact.

Table 8.1: Percentage distribution of household by the status of income change due to the impact of the economic crisis from March 2022

	Increase (%)	Decrease (%)	Same as before (%)
Sri Lanka	5.6	60.5	33.9
Urban	6.6	56.8	36.5
Rural	5.1	61.2	33.7
Estate	9.9	62.9	27.2

Table 8.1 shows that the majority, including 60.5 percent of households, have experienced a decrease in their total income because of the economic crisis. Conversely, a small percentage, specifically 5.6 percent of households reported an increase in their income within this challenging time. Approximately 33.9 percent of households, the aggregate

Figure 8.1

Percentage distribution of reasons to decrease the household average monthly income due to the impact of economic crisis from March 2022

Source:
Department of Census and Statistics, Sri Lanka

DCS

income has remained unchanged despite the crisis. The economic crisis has brought about diverse effects on household income and expenditure, prompting the adoption of various coping strategies to mitigate its impact. The survey has identified and categorized these impacts and coping mechanisms.

During the economic crisis, numerous households cited various reasons contributing to the reduction in their average monthly income. According to Figure 8.1, the most frequently reported cause, accounting for 48.7 percent of respondents, was "Less working hours," signifying a significant impact on household income. Conversely, "Salaries/allowances/commissions reduced" emerged as the least reported reasons among households for the decline in their

average monthly income. There is a significance difference in reason for decreasing household average monthly income among sectors.

During the income decline, households employed various coping strategies to mitigate the impact of the economic crisis. As indicated in Figure 8.2, the most commonly reported coping strategy, utilized by 6.6 percent of households experiencing reduced income, was "Turning to a secondary job or an additional source of income." Conversely, the least reported coping strategy among these households was "Loans, mortgages, or seeking food/money from others." It's noteworthy that a substantial majority, comprising 73.6 percent of households facing reduced income, did not adopt any specific coping strategy during this period.

Figure 8.2

Percentage distribution of coping strategies that adopted for the impact of the economic crisis on household income

Source:

Department of Census and Statistics, Sri Lanka

The estate sector adopts at least one coping strategy and has taken more steps to cope compared to the rural or urban sectors.

The household expenditure changes due to the impact of the economic crisis. The survey findings offer a detailed overview of how the economic crisis has influenced household spending patterns. The data reveals distinct variations in household expenditure, broadly classified into three primary categories: increase, decrease, and no change.

Table 8.2 : Percentage distribution of household by the status of expenditure change due to the impact of the economic crisis from March 2022

	Increase (%)	Decrease (%)	Same as before (%)
Sri Lanka	91.1	3.6	5.3
Urban	94.2	2.4	3.4
Rural	90.4	3.7	5.9
Estate	90.3	7.3	2.4

According to Table 8.2, the breakdown of household expenditure changes due to the economic crisis reveals that only 3.6 percent of households reported a decrease in their total expenditure while a significant majority, 91.1 percent of households, indicated that their expenditure had increased. Approximately 5.3 percent of households reported that their aggregate expenditure remained unchanged despite the impact of the economic crisis.

Figure 8.3 illustrates the categorized reasons contributing to the decrease in household average monthly expenditure due to the impact of the economic crisis since March 2022. This distribution of reasons helps in understanding the factors influencing the reductions in spending and provides insights into the strategies employed by households to manage their finances during these challenging times.

Figure 8.3
Percentage distribution of reasons to decrease the household average monthly expenditure due to the impact of economic crisis from March 2022

Source:
Department of Census and Statistics, Sri Lanka

Figure 8.3 displays the percentage distribution of each categorized reason, showing the relative significance of various factors influencing reduced monthly expenditure. The primary reason reported by households for reducing their average monthly expenditure, accounting for 77.0 percent was to adjust their spending in line with the decrease income. This means that households adjusted their spending habits to match the reduction in their overall income. It's worth noting that many households provided multiple reasons for decreasing their expenses, as depicted in Figure 8.3.

The reasons for the decrease in household average monthly expenditure vary across sectors. Reduced consumption was the most commonly reported in the estate sector, accounting for 93.8 percent. In the urban and rural sectors, the most common reason was adjusting expenses to align with the decrease in income by 74.2 percent and

80.1 percent of households respectively.

Discontinuing or stop educational activity was the least reported reason across all sectors. Notably the urban sector did not report a decrease in food expenditure due to caring out agriculture activities.

Among households that reported an increase in their average monthly expenditure, the most commonly reported reason, accounting for 99.1 percent of responses, was the increase in food expenses. This indicates that the majority of these households experienced a rise in their spending specifically on food items. Additionally, it's important to note that multiple reasons were reported by these households, as shown in Figure 8.4.

The pattern of reasons for the increase in household average monthly expenditure at the national level was also observed across all sectors.

Table 8.3 : Percentage distribution of household that use at least one coping strategy for household expenditure

	Percentage (%)
Sri Lanka	97.2
Urban	97.2
Rural	97.1
Estate	98.9

According to the Table 8.3, a significantly high proportion, approximately 97.2 percent of households, employed at least one coping strategy to manage their household expenditure. Many of these households utilized multiple coping strategies. As highlighted in Table 8.3, this suggests that most households employed various methods to address and handle their expenses, indicating a diverse range of approaches taken by these households to manage their financial situation.

Figure 8.5 provides a breakdown showing the percentage distribution of households

that have implemented these strategies. Notably, the data underscores that "Limiting or controlling expenses" emerges as the most prevalent coping strategy, reported by 75.3 percent of respondents. It's essential to note that households often employ multiple strategies simultaneously to cope with the economic downturn and its repercussions on their households' expenditures.

"Limiting or controlling expenses" is the most commonly reported coping strategy in urban sector accounting for 74.5 percent. In contrast, "dietary change" is the most frequently reported coping strategy for rural (76.7%) and estate sector (81.0 %), followed by "limiting or controlling expenses" which account for 75.5 percent and 75.1 percent in these sectors respectively. In all sectors a significant number of households reported at least one coping strategy.

Figure 8.5

Percentage distribution of coping strategies that adopted for the impact of the economic crisis on household expenditure

Source:
Department of Census and Statistics, Sri Lanka

DCS

Expenditure level and coping strategies

The coping strategies are grouped into six categories to present clearly.

- Dietary change - Getting cheaper food / changing diet plan / get alternative foods / reducing the quantity of food intake / reducing the number of meals taken per day.
- Increase food availability - Attending on horticulture or animal husbandry / Food preservation or storage.
- Limit controlling expenses - Adopt methods to reduce electricity consumption / Referral to government health centres or reduce health expenses / Limit the frequency of getting services (salon, house cleaning ect.) / Reduce or stop servant's work / Reduce or stopping of expenses on leisure and entertainment / Use alternative cooking fuel instead of electricity or gas.
- Educations control / limit - Limit expenses for education / Sending children to low-cost schools or low – transport cost school / Stop educational activities.
- Loan / Sale / Mortgage - Sale or mortgage of land, property, furniture / Borrowing money or food or goods.
- Reduce savings / withdrawal - Withdrawal of deposits / Reduce or stop savings.

Figure 8.6 shows the percentage distribution of coping strategies among household expenditure categories adapted for the economic crisis. The impact of economic crisis on household expenditure has significance difference across household expenditure categories. The coping strategies, "Reduce savings / do withdrawals" and "limit / control expense" show an increase in use when the household expenditure is increased. The low expenditure groups use "Dietary change" rather than the high expenditure group to overcome the impact of economic crisis.

"Increase food availability" didn't show much difference among expenditure groups, regardless of expenditure people try to increase food availability to adapt with impact. "Loan/ sale/ mortgage" is more popular among middle expenditure groups than lower or higher expenditure groups. There is a big difference in the use of coping strategies by each expenditure group among sectors.

Figure 8.6

Percentage distribution of coping strategies adopted for the impact of the economic crisis on household expenditure by household expenditure group, Sri Lanka and sector

DCS

9. Indebtedness

During an economic crisis, families in Sri Lanka often face tough times due to job losses, reduced incomes, and higher inflation rates. As a result, households may struggle to meet their financial obligations, leading them to take on more debt to cover basic expenses like food, housing, and healthcare. This leads to a significant increase in household debt burdens as families struggle to make ends meet. Unfortunately, the inability to repay these debts on time can lead to further financial difficulties, including late payments, defaults, and reliance on credit, which only exacerbates the problem.

The increased levels of household debt not only create financial stress but also have significant implications for mental well-being. The constant pressure of managing debt, coupled with the uncertainty of the economic situation, can lead to increased anxiety and psychological strain among individuals and families. Moreover, the economic downturn could lead to serious problems like losing homes or going bankrupt as households struggle to manage their debts. These events can have long-lasting effects on individuals' financial stability and overall well-being.

In response to such challenges, policymakers often implement measures aimed at alleviating household debt

burdens and supporting economic recovery. Overall, addressing the challenges associated with household indebtedness during an economic crisis requires a comprehensive approach involving both short-term relief measures and long-term strategies to promote financial resilience and stability among households.

The recent survey findings reveal that a substantial portion of households in Sri Lanka, about 54.9 percent, are currently dealing with debt. This means that more than half of the households in the country have financial obligations or outstanding debts that they are trying to manage or pay off. This level of indebtedness poses significant challenges for household finances, budgeting, and overall financial stability, particularly during times of economic hardship or uncertainty.

Figure 9.1 provides insights into the percentage distribution of currently indebted households in Sri Lanka based on

different lending sources. The data reveals the diversity of financial institutions and channels through which households have acquired financial obligations.

The highest proportion of indebtedness is attributed to mortgage matters (31.0%). Banks account for the second-largest share of indebtedness at 21.9 percent, highlighting the role of formal banking institutions in providing credit to households. Money lenders and microfinance institutions also play substantial roles, with percentages of 9.7 percent and 8.7 percent, respectively, indicating the prevalence of informal lending sources in the country's financial landscape.

Moreover, a smaller proportion of indebtedness was attributed to borrowing from Samurdhi Bank (7.1%), Place of work (5.2%) and credit card usage (1.8%). This comprehensive breakdown underscores the complex nature of household indebtedness in Sri Lanka and the diverse array of financial instruments and providers involved in meeting households' financing needs.

Figure 9.2 provides a comprehensive breakdown of the reasons for household indebtedness in Sri Lanka. Approximately 22.3 percent, loans taken to address daily food needs, highlighting the significant financial challenges to households in meeting their basic necessities. This underlines the urgent need for interventions to alleviate food insecurity and enhance household financial resilience.

Additionally, 17.0 percent of indebted households have acquired loans for constructing or repairing residences. This statistic points to the persistent difficulties in accessing affordable housing and ensuring adequate shelter for families across the country. Addressing housing affordability issues is crucial for improving living standards and promoting social and economic stability.

Furthermore, 15.7 percent of indebted households have specifically obtained loans for economic activities. This highlights the role of credit in development entrepreneurship, small business development, and economic growth within households. Supporting these economic initiatives can contribute to job creation, income generation, and overall household prosperity. 11.9 percent of indebted households have acquired loans to settle previous debts. Moreover, a similar proportion of indebted households have obtained loans for buying

land/houses/vehicles (9.9%) and Health reasons (9.9%).

Understanding these factors is crucial for policymakers and financial institutions to develop targeted interventions and solutions to alleviate economic burdens on households. Efforts such as debt relief initiatives, financial education programs, and economic stimulus measures can help mitigate the impact of household indebtedness and support economic recovery efforts in Sri Lanka.

Figure 9.3 illustrates the percentage distribution of households affected by the economic crisis in terms of their debt status.

Figure 9.3
Percentage of Indebtedness and non-indebted households affected by economic crisis

Source:
Department of Census and Statistics, Sri Lanka

DCS

In this depiction, 22 percent of households are shown as being in debt, while the larger percentage, 78 percent, is depicted as not being indebted. This highlights that many households in Sri Lanka were dealing with debt while facing economic challenges.

10. Food Security

“Food security exists when all people, at all times, have physical and economic access to sufficient safe and nutritious food, that meets their dietary needs and food preferences for an active and healthy life” by Food and Agriculture Organization (FAO) (1996).

Therefore, the establishment of food security in the country is essential to build a healthy nation. Food availability, food access, utilization and stability are the key factors to determine food security. FAO introduced the Consolidated Approach for Reporting Indicators of Food Security (CARI) to combine different food security indicators into one index to measure these key factors.

Considering the current status of household consumption and coping capacity through economic vulnerability and livelihood coping strategies, CARI measures availability, access to food and stability. Therefore, mainly Food Consumption Score (FCS) and reduce Coping Strategies Index (rCSI) are used to measure the adequacy of households' current food consumption.

Information on food consumption of Sri Lankan households was collected under section 4 of this household survey on the impact of the economic crisis. The indicators have been calculated according

to World Food Programme (WFP) guidelines.

The Food Consumption Score (FCS) is a measure used to evaluate a household's current status of food consumption. It serves as a proxy indicator for assessing how easily households can access food and is a standard indicator used by WFP to categorize households into various groups based on the sufficiency and quality of the foods, they consumed in the prior to being surveyed.

Food Consumption Score (FCS)

FCS is a composite indicator that considers the *dietary diversity*, *frequency* and *nutritional importance* of the food groups consumed by the households.

According to the WFP,

- **Dietary Diversity** is calculated by using number of each food items consumed over a reference period.
- **Food Frequency** is the number days during the past seven days that a specific food item has been consumed.
- **Nutritional importance** is calculated after weighting food groups according to nutritional importance.

The following weights are allocated to each food groups based on their nutritional importance to calculate food consumption scores (FCS). It varies from 4 to 0.5.

Food groups weights

Food Consumption Score (FCS) is calculated using frequencies of consumption and above weights. Households are classified into three groups poor, borderline, and acceptable considering their FCS values.

Nationally, the average Food Consumption Score (FCS) was found to be 70.2. Based on this indicator, 93 percent of the households were categorized as having acceptable food consumption while 7 percent had borderline or poor consumption.

Figure 10.1
Household food consumption in Sri Lanka

Source:
Department of Census and Statistics, Sri Lanka

Reduced Coping Strategy Index (rCSI) of Sri Lanka

According to the World Food Program (WFP), reduced Coping Strategy Index (rCSI) is an indicator used to compare the hardship faced by households due to shortage of food. Therefore, section 10 of the survey schedule asked about how many days, in the last 7 days, did your households use following strategies due to a lack of food or money to buy it.

1. Relied on less preferred, less expensive food
2. Borrowed food or relied on help from friends or relatives
3. Reduced the number of meals eaten per day

4. Reduced portion size of meal
5. Restricted consumption by adults in order for small children to eat

Considering severity of the hardships, weights were allocated to each strategy and a reduced Coping Strategy Index (rCSI) was calculated using those weights.

rCSI	Results of the survey indicates that rCSI of Sri Lanka was 7.48 out of maximum 56.
7.48	

Higher rCSI values signify more acute challenges in dealing with food shortages and meeting basic nutritional needs within each specific sector. A higher rCSI score indicates that households were employing more severe coping mechanisms due to food shortages. It can include actions like relying on less preferred and less expensive food options, borrowing food or seeking assistance from relatives or other sources, reducing the number of meals consumed in a day and taking drastic measures like restricting the consumption of adults so that small children can eat adequately. These measures often involve compromises in the quality, quantity, and regularity of meals, highlighting the need for interventions and support to alleviate food shortages in these areas. Since, the estate sector rCSI is higher than other sectors. Estate sector was facing more food insecurity than other sectors during the economic crisis.

Livelihood-based coping Strategies - Food Security (LCS-FS)

According to WFP, this indicator reflects households' medium and longer-term coping capacity when they face lacking foods or money to buy food and their capability to overcome challenges in the future.

Information related to the households' coping strategies when having food shortage were collected under the section 10 of this survey. This LCS-FS indicator was calculated using that information according to the WFP guideline. Those households' coping strategies were categorized as stress, crisis and emergency according to their severity levels.

Stress	Crisis	Emergency
Indicates a reduced ability to deal with future shocks due to a current reduction in resources or increase in debt	Directly reduces future productivity including human capital format	Affects future productivity but are extremely difficult to reverse or more dramatic in nature

Source: Livelihood Coping Strategies for Food Security Guidance Note

Households not only adapted their food consumption habits but also employed diverse livelihood-based coping strategies to address the challenges of inadequate food access and availability. Some of these strategies may have adverse effects on their income generation and ability to respond to future shocks.

Figure 10.2

Percentage of households not relied on coping strategies, relied on stress, crisis and emergency strategies by sector

Source: Department of Census and Statistics, Sri Lanka

DCS

Figure 10.2 presents that 47 percent of total households relied on coping strategies due to lack of foods or money to buy it during last 30 days.

The survey revealed that 21 percent of the households nationwide had implemented crisis strategy to address the scarcity of food or financial constraints. This was followed by stress strategies, and it is about 19 percent. Notably, in the rural sector, this crisis strategy used proportion rose to 23 percent of households.

Figure 10.3

Proportion of households relying on each of livelihood coping strategies for food security

Source: Department of Census and Statistics, Sri Lanka

DCS

Figure 10.3 presents that, reducing their expenditure on health or education (24%), spending savings/skipped debt payment (24%), borrowing money from formal lender/bank (15%), purchasing food/non-food on credit (15%) are mostly applied coping strategies to bear the situation. In addition to that 11 percent of households had sold gold jewellery to purchase foods.

Food Expenditure Share (FES)

Food Expenditure Share (FES) indicator is an important indicator to present the economic vulnerability of the households. More economically vulnerable households spend more on foods relative to the other consumed items or services.

$$\text{Food Expenditure Share} = \frac{\text{Household monthly food expenditure}}{\text{Total expenditure}} \times 100$$

In this survey expenditure on food items and non-food items were collected from section 4.1 and section 4.2 of the schedule.

Figure 10.4

Proportion of households' food expenditure

Source: Department of Census and Statistics, Sri Lanka

DCS

Figure 10.4 revealed that average household monthly food expenditure share for the Sri Lanka is 56 percent.

Figure 10.5
Proportion of households' food expenditure in sectors

Source:
Department of Census and Statistics, Sri Lanka

Figure 10.5 shows that households in the estate sector spend a higher percentage of their total budget on food items (61%) compared to other sectors.

Food security condition can be identified by considering value of food expenditure share.

Food Expenditure Share	Food Secure	Marginally Food Secure	Moderately Food Insecure	Severely Food Insecure
	<50%	50%-65%	65%-75%	≥75%

Figure 10.6 revealed that one-third of households in Sri Lanka have spent less than 50 percent of their expenditure on their foods (food secure) and one-tenth of households spent more than 75 percent of their total expenditure on their foods (severely food insecure) in Sri Lanka.

Figure 10.6
Proportion of households' food security status in Sri Lanka according to food expenditure share

Source:
Department of Census and Statistics, Sri Lanka

Food Security Index (CARI)

Overall food prevalence can be calculated considering all indicators. According to WFP guideline, definition of food secure,

CARI	Food Secure	Marginally Food Secure	Moderately Food Insecure	Severely Food Insecure
	Able to meet food needs without engaging in reduced and livelihood coping strategies for food security	Has minimally inadequate food consumption, relies on reduced coping and applies stress coping strategies to secure food	Has food consumption gaps and unable to meet required food needs without applying crisis coping strategies	Has extreme food consumption gaps, OR has extreme loss of livelihood assets will lead to food consumption gaps, or worse

Source: CARI guidance 2021, WAM Resource Centre

marginally food secure, moderately food insecure and severely food insecure are as follows.

Figure 10.7 illustrates that 28 percent of households are food secure, while 58 percent are marginally food secure in Sri Lanka according to CARI index. Additionally, 14 percent of households experienced food consumption gaps and they have relied on crisis coping strategies to meet their food requirements. Only 0.4 percent of households are severe food insecure.

Figure 10.7
Proportion of households' food security status in Sri Lanka according to CARI

Source: Department of Census and Statistics, Sri Lanka

DCS

Figure 10.8
Proportion of households' food security status by sector according to CARI

Source: Department of Census and Statistics, Sri Lanka

DCS

According to Figure 10.8, nearly, 35 percent of households were food secure and 53 percent of households are marginally food secure in urban sector. When considering the rural sector, 27 percent of households were food secure while 59 percent of households were marginally food secure. Estate sector shows more food insecure than other two sectors. Since 67 percent of marginally food secure and 18 percent of households were moderately food secure.
